WHAT IS CLAIMED IS:

1. A toner obtained by polymerizing a polymerizable monomer composition comprising at least a polymerizable monomer and a colorant, wherein:

the polymerizable monomer composition is polymerized using a polymerization initiator comprising a redox initiator which comprises an organic peroxide with a 10-hour half-life temperature of 86°C or higher and a reducing agent;

the toner has a ratio of a weight-average particle diameter to a number-average particle diameter (weight-average particle diameter/number-average particle diameter) of 1.40 or less;

the toner has top of a main-peak in a molecular weight range of 5,000 to 50,000 in a molecular weight distribution measured using a gel permeation chromatography (GPC) of a THF-soluble part thereof; and

the toner contains t-butanol with a content of 0.1 to 1,000 ppm.

- 2. The toner according to claim 1, wherein the reducing agent is an organic compound which does not comprise a sulfur atom or a nitrogen atom.
- 3. The toner according to claim 1, wherein the reducing agent is an ascorbic acid or an ascorbate.

- 4. The toner according to claim 1, wherein the organic peroxide is selected from the group consisting of t-butylhydroperoxide, di-t-butylperoxide, and t-butylperoxyisopropyl monocarbonate.
- 5. The toner according to claim 1, wherein the polymerizable monomer composition further comprises a wax.
- 6. The toner according to claim 5, wherein 1 to 30% by mass of the wax is contained with respect to a binder resin.
- 7. The toner according to claim 1, wherein the toner has a mode circularity of 0.99 or more.
- 8. The toner according to claim 5, wherein the wax has an endothermic peak measured by a differential thermal analysis in a range of 40 to $150\,^{\circ}\text{C}$.
- 9. The toner according to claim 1, further comprising an inorganic fine particle having a number-average primary particle diameter of 4 to 100 nm on a surface of the toner.
 - 10. The toner according to claim 9, wherein the

inorganic fine particle comprises at least one selected from the group consisting of silica, titanium oxide, and alumina.

- 11. The toner according to claim 9, wherein a rate of liberation of the inorganic fine particle from the toner is 0.1 to 2.0%.
- 12. The toner according to claim 1, wherein the colorant comprises a chromatic colorant.
- 13. The toner according to claim 1, further comprising a magnetic substance.
- 14. A toner according to claim 1, wherein the toner has an average circularity of 0.970 or more.
- polymerizable monomer composition comprising at least a polymerizable monomer and a colorant, wherein the polymerizable monomer composition is polymerized using a polymerization initiator comprising a redox initiator which comprises an organic peroxide with a 10-hour half-life temperature of 86°C or higher and a reducing agent.
